<u>New Pet Shopping</u> <u>List</u>

- ☑ Water bottle
- \blacksquare Food dishes
- Housing Large cage 2 c.f. per rat recommended
- ☑ Toys Igloo, hammocks, PVC tubes, hanging bird toys
- Safe litter such as aspen shavings, CareFresh, Yesterday's News, shredded paper, toilet paper or paper towels, old ripped up towels or sheets. Don't use clay based kitty litter, as it can clog in their stomach.
- ✓ Food lab blocks, fresh fruit & veggies, treats such as yogurt drops (use in moderation).
- ✓ Veterinarian It's important you have a vet that has experience with rats. All animals can require vet care and having one in advance provides peace of mind.

Common Myths

MYTH: Rats are dirty animals and spread the plague!

FACT: Rats are very clean; spending ¹/₂ their waking hours grooming and cleaning themselves. Because of this, they do not smell unpleasant, though their cage will need to be cleaned, as they can't do this themselves. The plague was spread by humans and fleas. In fact, rats are more likely to catch something from you, than you will from them!

MYTH: Rats bite! FACT: You're more likely to be bitten by a dog.

The Perfect Pet

Rats make wonderful pets. They are highly intelligent, friendly, loyal and playful animals, and love human attention.

They're also social creatures and need the company of other rats, so it's important you get at least 2 rats of the same gender. This won't stop them from bonding with you. Confident rats will bond more closely to their human owner.

Handling & Play

Rats need at least an hour outside of their cage a day to play and interact with you.

When you pick up your rat, never pick it up by its tail. This is stressful, and can be painful for them and cause injury; it also makes them feel unsafe. Instead, gently scoop your rat up using one or both hands from underneath around the middle, supporting their feet.

<u>Diet</u>

Rats generally need their diet to be about 75-80% carbohydrates, 12 - 18 % protein, and around 4 - 6% fat. Seed mixes are too high in fat and protein and shouldn't be their staple diet. Lab blocks such as Harlan Teklad are an excellent food choice. A relatively decent diet can be found at www.ratsrule.com/diet.htm. Always supplement your dry food with a little fresh fruit and vegetables daily. Healthy leftovers from your dinner are ok too. Rats should also have access to fresh water at all times, supplied in a water bottle. Harlan Teklad is available for purchase from Wee Companions.

Some foods are dangerous to rats. For more information, check out the Resources section.

Housing

Rats need lots of space to run around, and require a fairly large cage. Mice and hamster cages are not suitable cages, as they're far too small. A large wire cage with levels is good, as are modified bird aviaries. Ideally, each rat should have 2 c.f. of cage space. See reference section for cage calculator.

Make sure the cage has good ventilation, as rat urine produces ammonia vapors that can hurt a rat's respiratory systems. A rat's cage needs to be cleaned at least weekly, and all the contents of the cage washed. Shredded aspen is a good bedding, as are CareFresh, Cell-Sorb and Yesterday's News. Shredded paper, soy based newspaper and old towels and rags are also acceptable. Pine and cedar beddings should not be used as they damage the respiratory tract, causing chronic respiratory disease, and asthma and liver problems. Several types of suitable bedding are available for purchase from Wee Companions.

Breeding

Wee Companions does not endorse the breeding of animals and any rats adopted from us are not to be bred under any circumstances

Breeding any animal responsibly means making an effort to improve the species as a whole, and rats are no exception. It's important to know the genetic history of rats that are bred so lines with possible health problems are not continued. Breeding rats should not be taken lightly.

The average litter is 10 - 12 but a rat can give birth to as many as 20 babies. If you breed, you should be prepared to keep any rats that you can't find homes for.

Rat Health Care

Like any animal, rats can get sick. Rats are susceptible to respiratory disease. Symptoms of a respiratory infection include any noises while breathing (grunting, whistling, wheezing, etc.) and sneezing. Lethargy is also a sign that your rat is not feeling well. Its important respiratory infections are treated promptly with a round of antibiotics.

Female rats are more prone to mammary tumors than males, especially as they age. Most tumors are benign, and can often be surgically removed.

Rats can also get scabby skin, caused by skin parasites such as mites or an allergy, or too much protein in the rat's diet.

Although rats are hardy little critters, they can fall ill and can do so quite quickly so any indication that your rat could be ill should be taken very seriously. Rats deserve as much care and responsibility as any other pet and that includes vet care.

Please establish a relationship with a rat knowledgeable vet before a medical emergency arises.

Rat Facts

- Rats are sexually mature at only 5 weeks of age. If females this age or older are housed with males, they are likely to be pregnant.
- Pet rats usually live to an age of two to three years.
- Males are larger than females and tend to be a bit less active.
- Rats cannot vomit and therefore do not need to fast before surgery
